

Ans 1. Photosynthesis is the process by which green plants use sunlight to convert carbon dioxide and water into glucose and oxygen.

Ans 2. The raw materials required are carbon dioxide, water, and sunlight, with chlorophyll as the catalyst.

Ans 3. Chlorophyll absorbs light energy, mainly in the red and blue wavelengths, and converts it into chemical energy used to drive the photosynthetic reactions.

Ans 5. Stomata are small pores on the leaf surface that allow gas exchange, letting carbon dioxide in and oxygen and water vapour out.

Ans 7. Light intensity and carbon dioxide concentration are two factors that affect the rate of photosynthesis.
